Quill Labs: Our Offers

We systemize business. Two offers, nine sub-offers.

Offer	Sub-offers
1. Digital Experiences	Brand Website, Landing Page, Portfolio Website, Website Redesign, Custom Website Build
2. Business Systems	Lead & Enquiry System, Booking & Appointment System, Customer Follow-up System, Custom System Build

Offer 1: Digital Experiences

Overview

We build websites that help a business look credible online, explain its value, show its work, and make it easy for a customer to take the next step. Every project is shaped by three choices:

1. **Website type:** what the website needs to achieve.
2. **Experience level:** how it looks and how visitors interact with it.
3. **Add-ons:** extra work beyond the agreed scope.

We pick the type first, then recommend an experience level based on the client's goals, content, budget and complexity.

Every website includes

- Responsive layout for the agreed screen sizes
- The agreed pages and sections
- Working navigation, links and calls to action
- A contact or enquiry pathway, including WhatsApp enquiry and lead capture where relevant
- Homepage SEO foundation (basic metadata and setup)
- Pre-launch quality checks
- Launch assistance as agreed
- Client handover and walkthrough

Choosing the right type

Client's main need	Sub-offer
I need a professional website for my business	Brand Website
I need to promote one service or offer	Landing Page
I need to showcase my work	Portfolio Website
I already have a website, but it needs improvement	Website Redesign

A project is classified by its main purpose. Secondary needs are scoped separately. If none of the four fits, it is a Custom Website Build.

Sub-offer 1: Brand Website

Purpose: a complete online presence that explains the business, builds credibility, presents services and helps visitors get in touch.

Who it is for: clinics and healthcare practices, restaurants and local businesses, agencies and studios, consultants and professional firms, businesses getting their first proper website.

It qualifies when: the client needs to present the whole business and several services, not a single offer.

What we make: Home, About, Services, testimonials or credentials where available, and Contact.

Not the right fit when: the client wants to promote one service (Landing Page) or lead with their work (Portfolio Website).

Example: a dental clinic wants visitors to understand its treatments, meet the team and enquire about appointments.

Sub-offer 2: Landing Page

Purpose: guide visitors toward one primary action instead of presenting the whole business.

Who it is for: businesses promoting one service, consultants with a specific package, companies running paid ads, businesses testing a new offer, organizations promoting an event or launch.

It qualifies when: there is one offer and one action you want the visitor to take.

What we make: headline, problem and solution, benefits, supporting proof, FAQs and one primary call to action.

Not the right fit when: the client needs to explain the full business. A campaign is built as a landing page inside the client's main website, not as a separate product.

Example: a clinic wants a dedicated page for one treatment with an appointment enquiry option.

Sub-offer 3: Portfolio Website

Purpose: show capability through projects, case studies and selected work.

Who it is for: graphic and UI/UX designers, photographers and videographers, developers and freelancers, creative studios, professionals whose work is their strongest proof.

It qualifies when: the work itself is the main reason a client would hire.

What we make: introduction, selected projects, case studies, services, About and Contact.

Personal brand websites: these are not a separate offer. Use a Portfolio Website when the goal is to showcase work, and a Brand Website when the goal is to explain the person's expertise and services.

Example: a designer wants prospects to browse past projects and enquire about hiring them.

Sub-offer 4: Website Redesign

Purpose: improve an existing website's design, structure, usability or technical quality.

Who it is for: businesses with outdated sites, sites that are hard to use on mobile, businesses whose services are poorly presented, brands whose site no longer reflects their positioning, businesses moving off an old platform.

It qualifies when: the client already has a website and the problem is how it works or looks, not the lack of one.

What we do: review the existing site, improve structure and design, rebuild the agreed pages, and plan the launch or migration.

Example: a consultancy needs clearer service pages, better navigation and a more professional presentation.

Sub-offer 5: Custom Website Build

Purpose: a website built around needs that the four standard types and three experience levels do not cover.

Who it is for: businesses and brands with a distinctive brief, such as a launch that needs custom interactive sequences, a site that mixes several types, or a project with bespoke design or functionality beyond the standard scope.

It qualifies when

- No single type fits the main purpose, or the project needs a bespoke structure.
- It needs custom design, interaction or functionality beyond the standard scope of an experience level or the add-ons.
- The scope can be written down before work starts.

How it works

1. Discovery: goals, audience, content and existing tools.
2. Written scope and design direction.
3. Fixed-scope quote.
4. Build.
5. Testing, including mobile usability and accessibility.
6. Launch and handover.

Not the right fit when: a standard type with add-ons already covers the need, or the custom part is a business process such as enquiry tracking, bookings or workflows. Those belong to Business Systems.

Example: a studio launching a new brand wants a story-led site with portfolio sections, custom interactions and a third-party integration.

Experience levels

The level sets the design and interaction style. It is separate from the website type. Not every combination suits every client, so the recommendation reflects the client's goal, content, budget and scope.

Level	The feel	What it can include	Best suited for
Essential	Clean, professional, straightforward	Clean layouts and typography, responsive design, simple navigation, lightweight interactions, clear calls to action, focus on readability and performance	Local businesses, clinics, consultants, clients who value clarity over effects

Level	The feel	What it can include	Best suited for
Motion	Expressive and interactive	Entrance animations, smooth transitions, hover effects, animated visual elements, custom interaction design, motion that guides attention	Creative agencies, premium service businesses, studios
Immersive	Story-driven, where moving through the site is part of the story	Scroll-triggered sequences, layered visuals, pinned or staged sections, custom transitions, advanced interaction, mobile and accessibility testing	Creative studios, distinctive brands, launches, businesses where visual storytelling is central

Essential must still look polished. Motion is more than decorative animation. Immersive is used only when the content benefits from it.

Add-ons

Paid extras for work beyond the agreed scope, each with a specific deliverable and a clear quote.

Add-on	What it covers
Additional page	A page beyond the agreed page count
Additional-page SEO	SEO setup for the extra pages
Copywriting	Writing or substantially rewriting website copy
Content and asset preparation	Sourcing, selecting and preparing approved images and assets
Website migration	Moving an existing site, with agreed redirects
Advanced analytics	Event tracking and conversion measurement beyond standard setup
Third-party integrations	Connecting external tools not in the original scope

Add-on	What it covers
Website care plan	Ongoing maintenance and support under agreed terms

Boundaries

- WhatsApp enquiry and lead capture are built into packages, not sold as add-ons.
- Automated WhatsApp replies, reminders and follow-up workflows belong to Business Systems.
- Domain renewals, hosting, paid tools and subscriptions are identified in every proposal.

Offer 2: Business Systems

Overview

We design the systems behind a business, so owners spend their time on work that grows the business instead of recurring tasks like chasing enquiries, confirming bookings and following up. We study how the business works, map the recurring processes, remove what is unneeded, and design a simpler system that reaches the same or a better result.

What counts as what

- **Automation:** one trigger leads to one or more actions with no human needed. Example: a form is filled and a WhatsApp reply goes out.
- **System:** automation plus a place where the data lives, a view the client can check, and a process they follow.
- **AI:** a step inside a system, used only where the input is messy, such as free text or documents.

We sell systems. Automations are the parts inside them.

How it is delivered

1. Discovery: a short call, or paid process mapping for custom builds.
2. Scope: written inclusions and exclusions.
3. Build: from a reusable foundation, configured to the client.
4. Test: step by step, with errors and missing data.
5. Handover: walkthrough, documentation and ownership details.
6. Optional ongoing support.

We design the system, explain how it works, and sometimes implement it. Running it day to day is the owner's job.

Sub-offer 1: Lead & Enquiry System

Problem it solves: enquiries arrive from the website, WhatsApp and Instagram, then get answered late or not at all, and nobody tracks them.

Who it is for: dentists and clinics, interior designers, gyms, restaurants (events and catering), and other service businesses.

It qualifies when: enquiries come in through more than one channel and replies are slow, missed or untracked.

What is included

- One enquiry tracker holding every source in one place
- Instant auto-reply
- Status pipeline (new, contacted, booked or won, lost)
- Follow-up reminders for the owner or staff
- Weekly summary of enquiries and follow-ups
- Walkthrough and handover document

Not included: ads, handling sales conversations for the client, writing marketing content, tools outside the agreed stack, unlimited changes.

How we measure success: response time, share of enquiries followed up, enquiries converted to bookings.

Sub-offer 2: Booking & Appointment System

Problem it solves: scheduling by calls and WhatsApp leads to double bookings and no-shows.

Who it is for: dentists and clinics, gyms, salons, interior designer consultations, restaurant tables.

It qualifies when: appointments or tables are arranged manually and the business loses time or revenue to scheduling errors and no-shows.

What is included

- Booking page
- Confirmation message
- Reminders before the appointment
- Calendar sync

- Reschedule and cancel link
- Simple day and week view

Not included: online payments and deposits, multi-branch setups, staff scheduling or payroll, inventory.

How we measure success: no-show rate, bookings per week, time spent scheduling.

Sub-offer 3: Customer Follow-up System

Problem it solves: one-time customers never return and reviews never get asked for.

Who it is for: businesses that depend on repeat visits, such as clinics, gyms, restaurants and salons.

It qualifies when: the business has a customer list but no consistent way to ask for reviews or bring past customers back.

What is included

- Post-visit review request
- Reactivation message for inactive customers
- Simple offer or birthday messages
- One customer list as the single source
- Handover document

Not included: bulk promotional campaigns, ad management, content writing beyond starter templates.

How we measure success: reviews collected, customers reactivated, repeat visits.

Sub-offer 4: Custom System Build

Problem it solves: a recurring business process that none of the three ready-built systems covers.

Who it is for: businesses with bigger needs, for example a client portal, inventory tracking, an internal approval workflow, invoice or document intake, or a project manager for a specific trade.

It qualifies when

- The need is not covered by sub-offers 1 to 3.
- The task is recurring and follows rules.
- It is tied to money, time or customers.
- It can run on tools the client already has, or the extra tool cost is clearly justified.

How it works

1. Process mapping: study how the business works, map every recurring process, and mark what is unneeded or excess.
2. Design: a new system that reaches the same or a better result in fewer, simpler steps.
3. Written design and fixed-scope quote.
4. Build.
5. Step-by-step testing of each part.
6. Handover with walkthrough and documentation.
7. Three-month testing period with the client to gather feedback and adjust.

Good to know: process mapping always comes before a quote, and AI is used only as a step where it solves a real problem.

Not the right fit when: the need is already covered by a ready-built system, or it is a one-off task that does not recur.
